Intro to Programming

Find the Maximum II

Write a python program that loops, asking the user on each iteration (turn) to either enter an integer (positive, negative or zero) or the word “done”. You do not know beforehand how many numbers they will enter.

Output

When the word “done” is entered your program should output two values, each on a separate line:

1. The largest integer that was entered.
2. The turn on which that integer was detected.

Remember, you input could potentially consist of all negative numbers!
