Summary

• Procedural Matters
• What you need to Know
• Practice Test and Answers
Procedural Matters Regarding the Midterm

• The test date
  – Section 007: October 12, 2016
  – Section 011: October 6, 2016
• I will take attendance – please bring your School ID
• The test will be graded on a curve
• The midterm counts for 20% of the final grade
Type of Questions that Could Be on the Test

- **Section I: Answer questions about Code**
  - What is printed out?
    - Look for “print” commands (sometimes include several rounds of interaction for a complex program)
  - What value is returned by a function?
    - Look for “return” commands
  - What is the value of a variable?
    - Look for the last assignment statement (with =)
  - Open ended questions:
    - What does a function called by the main program do?
    - What are the conditions that will cause the program to end?
      - look at *if* and *while* statements to figure out answer
    - Give some plausible input and output for a program (trace what the program does).

- **Section II: Write functions that solve stated problems**
  - Read questions carefully
  - Common errors:
    - Functions that solve problem not stated in the question
    - Functions without input parameters that only solve problem for sample input
      - Example: function adds only 500 and 3457, but it really should add any 2 numbers
What you should know

• Topics: algorithm, function, program, operator, input, output, side effect, variable, data types, if statements, else, decision trees, loops

• Know how to:
  – Define functions
  – Use input parameters to functions
  – Use input statements
  – Assign values to variables
  – Return values from functions and operators
  – Use print statements, including the sep and end keywords
  – Import modules
  – Use data types and coerce (or cast) one data type to another
  – Write simple functions that work and are easy to understand, due to comments and variable/function names
  – If/elif/else statements and basic decision trees
  – Use for loops and while loops
Algorithms

– May be asked to implement an algorithm in Python

– Pseudo Code: a series of ordered statements
  • Structured using line numbers, indents, bullets, etc.
  • Connected by logical and temporal connectors
    – *if, else, unless, not, until, when*
  • Includes Loops using various terms, including
    – repeat action until condition is satisfied
    – do action X times

– Flow Chart: Connected Series of Boxes
  • circles/ovals = start/end
  • rectangles = steps in processing
  • diamonds = decisions
  • arrows = sequence of steps
Functions

• Programming language Functions have 3 optional features:
  – Input (via parameters)
  – Output (return statements)
  – Side effects (print statements and other effects)
• Using the “input” function to solicit interactive input from a user
• print versus return
  – print is significant for its side effect—printing to computer screen
  – return
    • Exits function
    • Provides a value to a function call – Example:
      – If: function1(a) returns 5 and function2(b) returns 10
      – Then: function(a) + function(b) = 15
Data Types

• Floats and Integers
• Strings
• Boolean (True or False)
• Nonetype (Output of void functions, like `print`)
• Ranges
String Components

• Two identical delimiters: ““, ’, ""

• The Characters between delimiters including:
  – digits (0-9)
  – letters(a,b,c,..z,A,B,C,...,Z, space)
  – escape characters: \n, \t, \\

• Sample Strings:
  – '!@#$%^&*()'
  – “This is an apostrophe: ' “
  – 'This is a double quote: “ ' 
  – ""Triple quotes can include ' or “ or between them""
More on Strings

• Special characters are often represented with the backslash + a character, together these are called “escape characters”
  – 'The quote \' and the newline \n are useful'

• When printed, a string will be displayed in a way that interprets these components.
  – The quote ' and the newline are useful
  – The delimiters are eliminated and escape characters are interpreted.
Numbers

• Integers:
  – No Decimal Place

• Float
  – Limited in Length
  – Used for numbers with decimals
  – Approximations using Scientific Notation

• Normal Division with Integer Input
  – Output is a float

• Integer Division (\(/\))
  – Input/Output are integers (output is floor of answer)

• Import Math library for many special functions/variables
Type Conversion Functions (Numbers)

• Float
  – Converts Integers and compatible strings to floats

• Int
  – Converts floats (by truncation) to integer
  – Converts compatible string to integer

• Converted Strings can participate in math operations
  – 5 * int('5')
  – 20 / float('5.5')
Converting Non-Strings to Strings

• `str(5.55)`
  – '5.55'

• Makes a string out of any type of object (using definition of that object)

• Once converted, non-strings can be combined with strings through concatenation
  – 'The number is '+str(5)
  – output = 5+100
  – 'The sum of 5 and 100 is '+ str(output)
Arithmetic Operators & the Assignment Operator

• Know all the mathematical operators and what they do: +, -, *, **, /, //, %

• Be familiar with the two equal signs
  – The assignment operator =
  – The test for equality operator ==

• Understand how most of the operators can be restated as functions
Boolean Operators

- **and, or, not**
  - True and True → True, True and False → False, False and True → False, False and False → False
  - not(True) → False, not(False) → True
  - False or False → False, True or False → True, False or True → True, True or True → True

- **<, >, <=, >=**
  - Expected meanings from math

- **==, !=**
  - 'is equal to', 'is not equal to'

- **in**
  - 2 purposes
    - in *for* loops – relates item to sequence
      - for character in 'abcd':
        - print(character)
    - Boolean operator that tests for membership:
      - 'a' in 'abcdefg' → True
      - 5 in range(4) → False
Making Code Readable

• Comments
  – ## Know How to use comments
  – ## Know Why to use comments

• Naming Variables and Functions
  – Choose names that are self explanatory

• Use Parentheses with Operators
  – Do not rely on order of operations
  – Many operators are not covered by PEMDAS
  – You may not know what the defaults are

Intro to: Computers & Programming
Review for Midterm 1
CSCI-UA.0002
Identifiers

• Functions
  – How to define functions
  – Legal names for functions
  – Using colon, parentheses and indents

• Variables
  – Legal names of variables
  – The difference between local and global variables
If/elif/Else Statements

- Syntax (elif and else parts optional)
  
  If + boolean-expression + :  
  
  body  
  
  elif + boolean-expression + :  
  
  body  
  
  else:  
  
  body

- Example:
  
  def classify_integer(integer):
    if integer==0:
      return('zero')
    elif (integer%2) == 0:
      return('even')
    else:
      return('odd')
for Loops

- The first line of a for loop:
  - Is of the form
    - for VARIABLE in SEQUENCE:
  - VARIABLE refers to some variable name (item, character, number, etc.)
  - SEQUENCE refers to a sequence (range(5), 'hello', etc.)
- The body of the loop is indented directly beneath the first line
  - The body repeats one time for each element in the sequence
  - On each iteration, VARIABLE is set to the next item in the sequence.
Sample loops” try in IDLE

• Sample for loop
  – def diagonal_print(word):
    number = 0
    for letter in word:
      print(number*' ',letter,sep='')
    number=number+1

• Sample while loop
  – def guess_my_number ():
    import random
    my_number = str(random.randint(1,10))
    guess = '100'
    while guess != my_number:
      guess = input('Guess my number: It is between 1 and 10: ')
      if guess != my_number:
        print('You guessed wrong. Try again')
    print('You are correct. My number is',my_number)
Basics of Planning a Program

• Figure out the big steps first and “pretend” that you have already written most of the functions.

• Then write the functions that you assume that you need. Writing these functions may involve pretending that more functions exist, but that is OK.

• Repeat process until you don't have to pretend anymore because the functions are simple enough to just write and be done.
Reminder: A Test is a Game

• Unfortunately, tests are imperfect for measuring a person's expertise because (independent of such expertise) some people know how to play the test game better than others

• How to win the test game
  – Study sample test instructions
  – Time is a crucial factor (you have 1 hour and fifteen minutes)
  – Do easy problems before hard ones
  – Do not spend a lot of time on low-point problems
  – Do not get stuck on details that you don't need
    • Solving all problems is more important than doing 1 problem elegantly
  – Go for partial credit on program questions (most points)
    • If you cannot program some detail – write pseudo code
    • Basic solution strategy is more important than perfect syntax
  – Budget Your time
    • 4 section 1 questions X 7.5 minutes = 30 minutes
    • 2 section 2 questions X 15 minutes = 30 minutes
    • 15 minutes left over to finish whatever you need to finish
The Midterm is Next Class

• Please feel free to ask me any questions
• We will go over the practice midterm in class
  – ask questions
• Suggested Studying Methods
  – Obvious
    • look over previous class lectures, notes, homeworks, etc
    • Practice problems of your choosing
  – Look at previous tests from Python classes I taught
    • My website: http://nlp.cs.nyu.edu/people/meyers.html
    • Old tests from both CSCI-UA.002 and V22.0002 websites may be helpful, although sometimes different material was covered.
  • Good luck!
