Method Abstraction and Stepwise Refinement

1. What does this program do?

2. What are the subproblems? Decompose the program. Moreover, what are the ‘steps’ of this program?
   - Ex. fetch user’s name

(The number of bullets is not the ‘correct answer’ just list what you can identify.)

3. What subproblems could be made into methods?

4. What would the names and signatures of those methods be? (ex returnType, name, parameterList)
