We want a program that will allow us to print a “grade list” of the students in a class.

The program should loop, asking for a name, midterm score, and final score. It should then echo the input, and print the information entered, plus the student’s average.

To exit the loop, the user enters ”done” in lower case. The program will print the summary information in a table (see above) including each student’s deviation from the class average. The program then prints the class average on the last line and then terminates.

**Notice**

In this version all the inputs are done first and then the report is printed. The outputs are lined up in neat columns. Finally, the deviations are calculated and printed.
