What Is Object-Oriented Programming?

“Computer programming that emphasizes the structure of data and their encapsulation with the procedures that operate upon it.” (Britannica Concise)

“An object is a software bundle of related variables and methods. Software objects are often used to model real-world objects you find in everyday life.” (Sun’s Java Tutorial)

“The idea behind object-oriented programming is [...] opposed to a traditional view in which a program may be seen as a collection of [...] procedures.” (Wikipedia)
“Object-oriented programming is claimed to promote greater flexibility and maintainability in programming, and is widely popular in large-scale software engineering.” (Wikipedia)
The Goal of This Course

- Learn how to build and evolve large-scale programs using object-oriented programming
  - Design: How do we think in objects?
  - Primitives: How do we express object orientation?
  - Implementation: How do we realize OO primitives?
How Do We Achieve This Goal?

- In-class lectures and discussions
  - Lectures to introduce topics and techniques
  - Q&A sessions to deepen understanding
- Course project: A translator from Java to C++
  - Written in Java, using xtc toolkit for source-to-source transformers
  - Two versions, with second version improving on first version
  - Teams of 4-5 students
From Java to C++

- Input: Java *with* inheritance and virtual methods
  - But without interfaces, nested classes, enums, generics, ...
- Output: C++ *without* inheritance, virtual methods, templates
  - I.e., a better C *with* namespaces, classes, operator overloading
Two versions

- **Version 1**
  - Challenge: Implement inheritance and virtual methods in translator
  - Due mid-term, with in-class presentation and written report

- **Version 2**
  - Challenge: Implement method overloading in translator
  - Also, integrate automatic memory management
  - Due end-of-term, again with presentation and written report
Don’t Panic

- I draw on translator for most lectures
  - We develop basic translation scheme in class, together
  - Every class has a scribe, who captures substance of discussion
    - Since the syllabus hasn’t changed, improve on last year’s notes
- We have plenty of Q&A sessions (almost $\frac{1}{3}$ of classes) and out-of-class meetings with groups
  - You drive the discussion
- xtc provides a lot of functionality
  - Though you need to learn how to use it
Some Highlights of xtc

- Facilities for representing and processing ASTs
  - (Abstract Syntax Tree = internal representation of a program)
- Parsers, type checkers, and pretty printers for Java and C
  - Convert from source, determine types, convert to source again
- Generic tool support
  - Command line flags, file search paths, error reporting,…
But Why...?
Translator from Java to C++?

- Is a real, large-scale program (and not just a toy)
  - Domain with biggest promised impact of OOP
- Exposes you to implementation of OOP primitives
  - While also integrating Java and C++
- Touches on (my own and others’) active research
  - How to make source-to-source transformers extensible?
Two Versions of Translator?

- Educational best practice
  - “Students can try, fail, receive feedback, and try again without impact on grade.” (Ken Bains)

- Software engineering best practice
  - “Plan to throw one away.” (Frederick Brooks Jr.)
Teams of Students?

- Places emphasis on collaborative learning
- Prepares you for reality in industry and academia
- Helps me keep the feedback process manageable
More Details on Course
Managing Textbooks

- For Java, “Object-Oriented Design & Patterns”
  - 2nd edition by Cay Horstmann

- For C++, “C++ for Java Programmers”
  - 1st edition by Mark Weiss

- If you have a different book on C++, you may use that

- You will need a good reference for C++ eventually
  - “The C++ Prog. Lang.”, Special Edition by Bjarne Stroustrup
Managing Your Tools

- Personally, I use the one true text editor and Unix tools
  - Powerful, flexible, and easy to automate

- Linux: you are ready to go

- Mac OS: install Apple’s developer tools

- Windows: forget about it, seriously
  - Dual boot into Linux
  - Install virtual machine monitor (e.g., “VirtualBox”), run Linux
Managing Your Tools (cont.)

- If you insist on an IDE, I recommend Eclipse
  - Java Development Tools (JDT)
    - Visual debugger, more extensive errors/warnings than JDK
    - Known to build xtc
  - C Development Tools (CDT)
    - You still need developer tools on Mac OS, Cygwin on Windows
    - I have no experience using them, so you are pretty much on your own
- XCode on the Mac works pretty well too
Managing the Groups

- Each group has an elected speaker
  - Strict term limit: You elect a new speaker mid-term
- Each group provides a weekly progress report
  - What did you accomplish?
  - What did you learn, find surprising, struggle with?
  - What are your plans for next week?
- Each group meets with me every X weeks
Managing Expectations

- I am quite interactive
  - Be prepared to actively participate in class
  - I will reward you with chocolate

- Working with other people can be quite challenging
  - Open and proactive communication is key to success

- The project is quite challenging
  - Be prepared to “cut your losses”
    - You can’t possibly translate all of Java into C++
    - But you can set justifiable priorities
Managing Expectations (cont.)

- Class is an integral part of this course
  - You really should attend
  - I tried mandatory attendance a few years back; students hated it
  - Nowadays I am simply appealing to your maturity and self-interest

- The course home page is an important part of this course
  - Shows exact requirements for project
  - Lists reading assignments, class notes
  - Provides links to useful material
Managing Grades

- 50%–60% for projects
  - Typically, same grade assigned to all members of group
  - Every group will grade all other groups; peer grades are advisory
- 20%–30% for class participation
  - Includes note taking
- 20% for final exam
How to Get Started

- Introduce yourself
  - In a few minutes
- Subscribe to the class mailing list
  - By tonight
- Form groups and elect a speaker
  - By Friday, September 10
- Get xtc running on your laptop
  - By Tuesday, September 14 before class
Contract

- I provide the overall structure of the course, introducing topics and techniques, sharing my experiences, and facilitating our conversation.

- You actively participate in all aspects of the course, sharing your ideas, questions, and concerns as well as realizing a significant project.

- Together, we explore how to leverage object-oriented programming to build large-scale programs.
