1  2. A look at the assembly...
2
3      To see the assembly code that the C compiler (gcc) produces:
4      $ gcc -O0 -S example.c
5      (then look at example.s)
6      NOTE: what we show below is not exactly what gcc produces. We have
7      simplified, omitted, and modified certain things.
8
9      main:
10         pushq  %rbp          # prologue: store caller's frame pointer
11         movq   %rsp, %rbp    # prologue: set frame pointer for new frame
12
13         subq   $16, %rsp     # prologue: make stack space
14
15         movq   $0, -8(%rbp)  # x = 0 (x lives at address rbp - 8)
16         movq   $8, -16(%rbp) # arg = 8 (arg lives at address rbp - 16)
17
18         leaq   -16(%rbp), %rdi # load the address of (rbp-16) into %rdi
19         # this implements "get ready to pass (&arg)
20         # to f"
21
22         call   f              # invoke f
23
24         movq   %rax, -8(%rbp) # x = (return value of f)
25
26         # eliding the rest of main()
27
28         f:
29         pushq  %rbp          # prologue: store caller's frame pointer
30         movq   %rsp, %rbp    # prologue: set frame pointer for new frame
31
32         subq   $32, %rsp     # prologue: make stack space
33         movq   %rdi, -24(%rbp) # Move ptr to the stack
34         # (ptr now lives at rbp - 24)
35         movq   $0, -8(%rbp)  # x = 0 (x's address is rbp - 8)
36
37         movq   -24(%rbp), %r8 # move 'ptr' to %r8
38         movq   (%r8), %r9    # dereference 'ptr' and save value to %r9
39         movq   %r9, %rdi     # Move the value of *ptr to rdi,
40         # so we can call g
41
42         call   g              # invoke g
43
44         movq   %rax, -8(%rbp) # x = (return value of g)
45         movq   -8(%rbp), %r10 # compute x + 1, part I
46         addq   $1, %r10        # compute x + 1, part II
47         movq   %r10, %rax     # Get ready to return x + 1
48
49         movq   %rbp, %rsp     # epilogue: undo stack frame
50         popq   %rbp          # epilogue: restore frame pointer from caller
51         ret                 # return
52
53         g:
54         pushq  %rbp          # prologue: store caller's frame pointer
55         movq   %rsp, %rbp    # prologue: set frame pointer for new frame
56         subq   $0x8, %rsp     # prologue: make stack space
57
58         ...
59
60         movq   %rbp, %rsp     # epilogue: undo stack frame
61         popq   %rbp          # epilogue: restore frame pointer from caller
62         ret                 # return

```
