Honors Analysis of Algorithms

Problem Set 2+3

Due on Mon, Oct 20, after the class

Collaboration is allowed, but you must write your own solutions. Proving correctness of algorithms is a must.

Problem 1

Suppose G(V, E) is a connected graph and $h : E \mapsto \mathbf{R}$ is an assignment of costs to its edges. Let $g : E \mapsto \mathbf{R}$ be another cost assignment that satisfies:

$$\forall e, e' \in E, \quad h(e) \le h(e') \Longleftrightarrow g(e) \le g(e').$$

Prove that there exists a spanning tree of G that is a minimum cost spanning tree with respect to costs $h(\cdot)$ as well as a minimum cost spanning tree with respect to costs $g(\cdot)$.

Solve: [Kleinberg Tardos]: Chapter 4, Problem 26, on page 202.

Note: The greedy algorithm for minimum spanning tree (taught in class) works even when costs are allowed to be negative.

Problem 2

Let G be an *n*-vertex connected graph with costs on the edges. Assume that all the edge costs are distinct.

- 1. Prove that G has a unique minimum cost spanning tree.
- 2. Give a polynomial time algorithm to find a spanning tree whose cost is the second smallest.
- 3. Give a polynomial time algorithm to find a cycle in G such that the maximum cost of edges in the cycle is minimum amongst all possible cycles. Assume that the graph has at least one cycle.

Problem 3

You are given a set of n intervals on a line:

$$(a_1, b_1], (a_2, b_2], \ldots, (a_n, b_n].$$

Design a polynomial time greedy algorithm to select minimum number of intervals whose union is the same as the union of all intervals.

Problem 4

Solve: [Kleinberg Tardos]: Chapter 4, Problem 29, on page 203.

Hint: First prove that a non-increasing sequence (d_1, d_2, \ldots, d_n) is a degree sequence of some n-vertex graph if and only if $(d_2 - 1, d_3 - 1, \ldots, d_{d_1+1} - 1, d_{d_1+2}, \ldots, d_n)$ is a degree sequence of some (n-1)-vertex graph.

Problem 5 (Dynamic Programming)

Given a tree with (possibly negative) weights assigned to its vertices, give a polynomial time algorithm to find a subtree with maximum weight. Note that a *subtree* is a connected subgraph of a tree.

Problem 6

Let G = (V, E) be a directed *acyclic* graph (i.e. it does not contain any directed cycle).

- 1. Prove that the graph must have a vertex t that has no outgoing edge.
- 2. Suppose |V| = n. A topological ordering of the acyclic graph is a labeling of its vertices by integers from 1 to n such that
 - Any two distinct vertices receive distinct labels.
 - Every (directed) edge goes from a vertex with a lower label to a vertex with a higher label.

Give a polynomial time algorithm to find a topological ordering of the graph.

3. Fix a node t that has no outgoing edge. For every node $v \in V$, let P(v) be the number of distinct paths from v to t. Define P(v) = 0 if no such path exists and define P(t) = 1 for convenience. Give a polynomial time algorithm to compute P(v) for every node v.

Problem 7 (Dynamic Programming)

Solve: [Kleinberg Tardos]: Chapter 6, Problem 21, on page 330.

Problem 8 (Dynamic Programming)

Solve: [Kleinberg Tardos]: Chapter 6, Problem 22, on page 330.

Problem 9 (Dynamic Programming)

Solve: [Kleinberg Tardos]: Chapter 6, Problem 28, on page 334.

Problem 10 (Dynamic Programming)

An independent set I in a graph is called *maximal* if the graph does not contain an independent set I' such that $I \subseteq I'$ and |I| < |I'|.

Given a tree on n vertices, and an integer $0 \le k \le n$, give a polynomial time algorithm to determine whether the tree has a maximal independent set of size k. (*Hint: Design an algorithm that solves* the problem for all possible values of k.).

Problem 11

Solve: [CLRS] Problem 17-2, Page 426.

Note: In (a), SEARCH need not run in logarithmic time. In (b), define an appropriate potential function so that insertion runs in amortized O(1) time. In (c), one does not expect the implementation to be very efficient.

Problem 12

Solve: [CLRS] Problem 17-3, Page 427.

Note: Assume that α is strictly larger than $\frac{1}{2}$ (and strictly less than 1). Ignore deletions (as everything would be similar to insertions).
