# DNA sequencing

Introduction	SUTTA assembler	Feature-Response Curve	Base-Calling and Assembly	Conclusion			
Shotgur	Shotgun sequence assembly						

• DNA sequence is sheared into a large number of small fragments.

- Assume: If two sequence reads share the same string of letters (overlap), then they <u>might</u> have originated from the same genomic location.
- **Goal**: Join the sequences together using a computer program called assembler (similar to solving a jigsaw puzzle).
- Use long-range data to resolve complex genomic structures.

A B A A B A

# Why is de-novo sequence assembly so difficult?

- NP-complete: natural reduction to the Shortest Superstring Problem (easy for totally random DNA sequences).
- Genomic structures: repeated regions, rearrangements, segmental duplications etc.
- Sequencing-Technology Dependent: algorithms must change to accommodate changes to read-length or nature and availability of long-range information.

SUTTA assembler

Feature-Response Curve

Base-Calling and Assembly

Conclusion

#### The Sense of the Approximation A wicked problem in search for a correct solution

#### Definition (Wicked Problem)

A **wicked** problem is a problem that is difficult or impossible to solve because of <u>incomplete</u>, <u>contradictory</u>, and <u>changing</u> requirements that are often difficult to recognize.

Incomplete, contradictory, changing requirements = <u>genome structure</u> ↓ Not complete and <u>biologically correct</u> mathematical formulation! ↓ Difficult to have a *sense of the approximation* of the sequence relative to the true sequence as they are being assembled

SUTTA assembler

Feature-Response Curve

Base-Calling and Assembly

Conclusion

# Genome Sequencing – History & Accuracy

#### Did we solve the problem?

- **1995**: Haemophilus Influenzae 1.8 Mbp,  $\sim$  30h.
- **2000**: *Drosophila* 120 Mbp, ~ week.
- 2001: 1st Human Genome draft 3 billion bp (genotypic), cost: \$3 billion!.

#### How well did we do?

- High rates of misassembly. [Semple, Bioinformatics for Geneticists, 2003]
- "Revolution Postponed: Why the Human Genome Project Has Been Disappointing" [Stephen S. Hall, Scientific American, 2010]
- Need for Quality Assessment! ⇒ Assemblathon (but only very recently, 2011).

#### Why did we not try to do better?

 "Since the problem is NP-hard (shortest superstring), any efficient reconstruction procedure must resort to heuristics." [Kececioglu and Myers, Algorithmica, 1995].

SUTTA assembler

Feature-Response Curve

Base-Calling and Assembly

Conclusion

# Issues and Challenges with current assemblers

- Sequencing Technology dependent.
- Difficult to integrate other bio-technologies (e.g., optical maps).
- Validation as a post-process.

Challenges of new sequencing technology:

- Short read lengths (up to 500 bps).
- Lots of data (requires distributed systems).

A B A A B A

# Goals

- **Detter formulation**  $\Rightarrow$  constrained optimization.
- **2** Better algorithms  $\Rightarrow$  more accurate.
- More flexibility ⇒ easy to integrate data from other bio-technologies.
- **Simultaneous validation**  $\Rightarrow$  using score functions.

Image: Image:

Conclusion

SUTTA assembler

Feature-Response Curve

Base-Calling and Assembly

Conclusion

# De Novo Genome Assembly

"An assembler must either "guess" (often incorrectly) the correct genome from among a large number of alternatives (a number that grows exponentially with the number of repeats in the genome) or restrict itself to assembling only the non-repetitive segments of the genome, thereby producing a fragmented assembly." [Pop and Salzberg, **Trends in Genetics**, 2008]

- We promote an approach with the following features:
  - Exhaustive search (not greedy).
  - Prune implausible overlays quickly (Branch-and-Bound).
  - Score-functions: combine different structural properties (e.g., transitivity, coverage, physical maps, etc).
  - Independent of the particular technology.

CLITTA				

Generate LEFT and RIGHT trees for the start read.

Best LEFT path is concatenated with the root and the best RIGHT path to create a globally optimal contig.

Bud Mishra (NYU)

August 2011 17 / 49

• Idea: if read A overlaps read B, and read B overlaps read C, we will score those overlaps strongly if in addition A and C also overlap.

$$\texttt{if}(\pi_{(A,B)} \land \pi_{(B,C)})\texttt{then}\{S_{\pi_{(A,B,C)}} = S_{\pi_{(A,B)}} + S_{\pi_{(B,C)}} + (\pi_{(A,C)}?S_{\pi_{(A,C)}}:0)\}$$

 This score cannot resolve repeats or haplotypic variations. Solution: augment the score with information for mate-pairs distances or optical map alignment to put an appropriate reward/penalty term.

< 3 > 4 3 >

E SQA

Introduction	SUTTA assembler	Feature-Response Curve	Base-Calling and Assembly	Conclusion
Lookahe How to resolv	ead ve repeats			

- Scenario: A potential repeat boundary between reads *A*, *B* and *C*. Read *A* overlaps both reads *B* and *C*, but *B* and *C* do not overlap each other.
- **Observation**: No decision can be made at this point on which read to keep/prune.
- Idea: Chose between reads *A* and *B* based on how well the mate-pairs (or other long-range data) in their subtree satisfy the length constraints.

SUTTA assembler ○○○○●○ Feature-Response Curve

Base-Calling and Assembly

Conclusion

#### Staphylococcus Epidermidis - 2,616,530 bp (SUTTA DotPlot)

Num. of reads: 60, 761; Avg read length: 900.2; Coverage: 19.9X

ELE DOG

・ロン ・聞と ・ヨン・

The lookahead procedure can easily handle dead-ends and bubbles.

**Dead-ends**: short branches of overlaps that extend only for very few steps (associated with base errors located close to the read ends).

**Strategy**: prune all the branches that are shorter than  $W_{de}$ .

**Bubbles**: false branches that reconnect after a small number of steps (caused by single nucleotide difference carried by a small subset of reads).

**Strategy**: check if branches converge after  $W_{bb}$  steps. Keep the branch with higher coverage.

SUTTA assembler

Feature-Response Curve ○●○○○○○○ Base-Calling and Assembly

Conclusion

# The need for Quality Assessment (motivation)

#### Definition (N50)

Given M contigs of size  $c_1, c_2, ..., c_M$ , N50 is defined as the largest number L such that the combined length of all contigs of length  $\geq L$  is at least 50% of the total length of all contigs.

Problem: emphasizes only size, without capturing quality!

Few very long contigs  $\Rightarrow$  useless if mis-assembled.

Many short contigs  $\Rightarrow$  too short for annotation efforts.

Other metric: count the number of mis-assembled contigs by alignments to the reference genome (if available). Problem: error types are not weighted accordingly.

Bud Mishra (NYU)

Introduction	SUTTA assembler	Feature-Response Curve	Base-Calling and Assembly	Conclusion
		0000000		

# Feature-Response Curve

**Goal**: evaluate the structural properties of the contigs and of the reads arranged in the layout.

• The Feature-Response curve characterizes the sensitivity (coverage) of the sequence assembler as a function of its discrimination threshold (number of features/errors).

Features include:

- (M) mate-pair orientations and separations,
- (K) repeat content by k-mer analysis,
- (C) depth-of-coverage,
- (P) correlated polymorphism in the read alignments, and
- (B) read alignment breakpoints to identify structurally suspicious regions of the assembly.

Conclusion

#### Experimental Comparison (De Novo Genome Assembly Results)

Feature-Response curve comparison by feature type

- 7 different genomes (Bacterial and Human).
- Simulated and real data.
- 16 different sequence assemblers (both ۰ for old Sanger and next-generation Illumina sequencing technology).
- All the generally accepted assembly paradigms (Greedy, OLC, SBH, Seed-and-Extend, and B&B).

Quality and performance of the existing assemblers varies dramatically!

イロト イ理ト イヨト イヨト

1.5

- PCA to remove redundant features.
- ICA to select the most independent (i.e. important) features.

**Long reads:** 21 organisms with length from  $\sim$ 11 Kbp to  $\sim$ 8 Mbp assembled with 5 assemblers. A total of 84 assemblies were used in the analysis.

Short reads: 5 datasets with coverages ranging from  $30 \times$  to  $130 \times$  assembled with 5 assemblers. A total of 82 assemblies were used in the analysis.

SUTTA assembler

Feature-Response Curve 0000000

**Base-Calling and Assembly** 

Conclusion

#### FRCurve on ICA-selected features Comparing 5 assemblers on the Brucella suiss dataset

 Observation: focus on the most informative features leads to better analysis.

Introduction	SUTTA assembler	Feature-Response Curve	Base-Calling and Assembly	Conclusion
Conclus	ion			

- A new sequence assembler (SUTTA) based on the branch-and-bound method that allows to perform assembly and validation concurrently.
- New metric that more faithfully captures the trade-off between assembly quality and contiguity (Feature-Response curve).
- A new Base-Caller (TotalRecaller) that has the ability to concurrently perform base-calling, alignment, error correction and SNP detection.

Introduction	SUTTA assembler	Feature-Response Curve	Base-Calling and Assembly	Conclusion

# Feature works

#### SUTTA:

- Scaling to large assembly projects  $\Rightarrow$  distributed computing.
- Optical Maps integration ⇒ <u>dovetailing</u> between short and long range data.
- Haplotypic (Human) genome assembly?

#### FRCurve:

- Increase specificity  $\Rightarrow$  reduced number of false-positive features.
- New specialized features ⇒ other technologies (not just mate-pairs).

Introduction	SUTTA assembler	Feature-Response Curve	Base-Calling and Assembly	Conclusion

# Sequence Assembly Problem

#### Definition (Sequence Assembly Problem (SAP))

Given a collection of fragment reads  $F = \{r_i\}_{i=1}^N$  and a tolerance level (error rate)  $\epsilon$ , find a reconstruction R whose layout  $L = \langle r_{j_1} \stackrel{\pi_1}{\rightleftharpoons} r_{j_2} \stackrel{\pi_2}{\rightleftharpoons} \cdots \stackrel{\pi_{N-1}}{\rightleftharpoons} r_{j_N} \rangle$  is  $\epsilon$ -valid, consistent and such that the following set of properties (oracles) are satisfied :

1. (Overlap-Constraint (O)) The cumulative overlap score O of the layout L is optimized:

2. (Mate-Pair-Constraint (MP)) The cumulative mate-pair score  $S_{MP}$  of the distance between reads in the layout L is consistent with the mate-pair constraints:

 $O(L) = \sum_{\substack{(r_i, r_j) \in L \\ \pi(r_i, r_j)}} S_O(r_i, r_j)$ 

 $MP(L) = \sum_{\substack{(r_i, r_j) \in L \\ (r_i \leftrightarrow r_j)}} S_{MP}(r_i, r_j)$ 

(日)

3. (Optical-Map-Constraint (OM)) The observed distribution of restriction enzyme sites in the layout *L*,  $C_{obs} = \langle a_1, a_2, ..., a_n \rangle$ , is consistent with the distribution of experimental optical map data  $C_{src} = \langle b_1, b_2, ..., b_n \rangle$  (obtained by a restriction enzyme digestion process).

We propose an algorithmic approach that can combine and use <u>concurrently</u> all the oracles while searching the optimal layout.

# Repeats

 If we look for a reconstruction of minimum length, the reconstructed string can have many errors due to repeats.

# Fragments and Overlaps

#### Fragments:

- A set of fragments/reads  $F = \{f_1, f_2, \dots, f_N\}$ , s.t.  $f_i \in \{A, C, G, T\}^*$ .
- Each fragment is represented as pairs of integers  $f_i = (s_i, e_i), i \in [1, |F|]$  where  $1 \le s_i, e_i \le |R|$ , and R is the reconstructed string (the order of  $s_i$  and  $e_i$  encodes the orientation of the fragment).

#### Overlaps:

Use Smith-Waterman algorithm to compute the best alignment between a pair of strings.

Predicate suffix<sub> $\pi$ </sub>(f) on a fragment f s.t.:

 $suffix_{\pi}(f) = \begin{cases} true \quad iff \quad suffix of f \text{ participates in the overlap } \pi \\ false \quad iff \quad prefix of f \text{ participates in the overlap } \pi \end{cases}$ 

# Layout Representation

• Let us define the layout *L* associated to a set of fragments  $F = \{f_1, f_2, \dots, f_N\}$  as follows:

$$L = f_1 \stackrel{\pi_1}{\rightleftharpoons} f_2 \stackrel{\pi_2}{\rightleftharpoons} f_3 \stackrel{\pi_3}{\rightleftharpoons} \cdots \stackrel{\pi_{N-1}}{\rightleftharpoons} f_N$$

where there are no containments (contained reads can be initially removed and then added later after the layout has been created)

#### Definition (Consistency Property)

A layout L is **consistent** if the following property holds for i = 2, ..., N - 1:

$$\stackrel{\pi_{i-1}}{\rightleftharpoons} f_i \stackrel{\pi_i}{\rightleftharpoons} \frac{\text{iff}}{\inf} \quad \text{suffix}_{\pi_{i-1}}(f_i) \neq \text{suffix}_{\pi_i}(f_i)$$

# Layout (Illustration)

Layout for a set of fragments  $F = \{A, B, C, D, E, F, G\}$  with sequence of overlaps  $\pi^{N}_{(A,B)}, \pi^{I}_{(B,C)}, \pi^{N}_{(C,D)}, \pi^{I}_{(D,E)}, \pi^{N}_{(E,F)}, \pi^{N}_{(F,G)}$ 

< 注 → < 注

#### Greedy Strategy (TIGR 1995, Phrap 1996, CAP3 1999)

Pick the highest scoring overlap.

Merge the two fragments (add this new sequence to the pool of sequences).

Heuristically correct regions of the overlay in some plausible manner (whenever possible).

Regions that do not yield to these error-correction heuristics are abandoned as irrecoverable and shown as gaps.

5 Repeat until no more merges can be done.

#### Overlap-Layout-Consensus (CELERA 2000, Minimus 2007)

- Idea: Construct a graph in which nodes represent reads and edges indicate overlaps.
- Goal: Need to solve an Hamiltonian path !

#### Strategy:

- Remove contained and transitivity edges.
- Collapse "unique connector" overlaps (chordal subgraph with no conflicting edges).
- Use mate-pairs to connect and order the contigs.
- Contigs correspond to nonintersecting simple paths in the reduced graph.

#### Sequencing by Hybridization (EULER 2001, Velvet 2008)

- Idea: Break the reads into overlapping *n*-mers (an *n*-mer is a substring of length *n*). Build a DeBruijn graph in which each edge is an *n*-mer and the source and destination nodes are respectively the *n* 1 prefix and *n* 1 suffix of the corresponding *n*-mer.
- Idela Goal: find a path that uses all the edges (an Eulerian path)  $\rightarrow$  linear time algorithm
- Real Goal: Eulerian-superpath: given an Eulerian graph and a sequence of paths, find an Eulerian path in the Eulerian graph that contains all these paths as sub-paths (*NP*-hard).
- **Note**: If no *n*-mer appears more than once in the genome then there exist at least one Eulerian path.
- Problem: Errors in the data can introduce many erroneous edges !

DeBruijn graph for the list  $L = \{AAA, AAC, ACA, CAC, CAA, CGC, GCG\}$ . The Euler path is:

Bud Mishra (NYU)

# SUTTA Pseudocode

Algorithm 1: SUTTA - pseudo code Input: Set of N reads Output: Set of contigs 1  $\mathcal{B} := \emptyset$ : /\* Forest of D-trees \*/ 2  $\mathcal{C} := \emptyset;$ /\* Set of contigs \*/ 3  $\mathcal{F} := \bigcup_{i=1}^{N} \{r_i\};$  /\* All the available reads/fragments \*/ 4 while  $(\mathcal{F} \neq \oslash)$  do  $r := \mathcal{F}.getNextRead()$ : 5 if  $(\neg isUsed(r) \land \neg isContained(r))$  then 6  $\mathcal{DT}$  := create double tree(r); 7  $\mathcal{B} := \mathcal{B} \cup \{\mathcal{DT}\};$ 8 Contig  $CTG := create\_contig(DT);$ 9  $\mathcal{C} := \mathcal{C} \cup \{\mathcal{CTG}\};$ 10 CTG.layout(); /\* Compute contig layout \*/ 11  $\mathcal{F} := \mathcal{F} \setminus \{ \mathcal{CTG}. \textit{reads} \}; \quad /* \text{ Remove used reads } */$ 12 end 13 end 14 return C;

#### Node expansion (High-level Description)

- Start with a random read (It will be the root of a tree; Use only the read that has not been "used" in a contig yet, or that is not "contained").
- Create RIGHT Tree: Start with an unexplored leaf node (a read) with the best score-value; Choose all its non-contained "right"-overlapping reads and expand the node by making them its children; Compute their scores. (Add the "contained" nodes along the way, while including them in the computed scores; Check that no read occurs repeatedly along any path of the tree). STOP when the tree cannot be expanded any further.
- Oreate LEFT Tree: Symmetric to previous step.

#### Node expansion (Branch-and-Bound)

Algorithm 2: Node expansion

**Input**: Start read  $r_0$ , max queue size K, percentage T of top ranking solutions, dead-end depth W<sub>de</sub>, bubble depth W<sub>bb</sub>, mate-pair depth Wmn Output: Best scoring leaf 1  $\mathcal{V} := \emptyset$ : /\* Set of leaves \*/  $2 \mathcal{L} := \{(r_0, g(r_0))\}; /* \text{ Live nodes (priority queue) }*/$ 3 while ( $\mathcal{L} \neq \oslash$ ) do  $\mathcal{L} := Prune(\mathcal{L}, K, T); /* \text{ Prune the queue } */ \\ r_i := \mathcal{L}.popNext(); /* \text{ Get the best scoring node } */$ 5  $\mathcal{E} := Extensions(r_i);$ 6 /\* Possible extensions \*/  $\mathcal{E}^{(1)} := Transitivity(\mathcal{E}, r_i); /* Transitivity pruning */$ 7  $\mathcal{E}^{(2)} := DeadEnds(\mathcal{E}^{(1)}, r_0, W_{de}); \quad /* \text{ Dead-end pruning } */$ 8  $\mathcal{E}^{(3)} := Bubbles(\mathcal{E}^{(2)}, r_0, W_{bb}); \qquad /* Bubble pruning */$ ۹  $\mathcal{E}^{(4)} := MatePairs(\mathcal{E}^{(3)}, r_0, W_{mn});$ /\* Mate pruning \*/ 10 if  $(|\mathcal{E}^{(4)}| == 0)$  then 11  $\mathcal{V} := \mathcal{V} \cup \{r_i\}$ : 12 /\* // is a leaf \*/ 13 else for (j=1 to  $|\mathcal{E}^{(4)}|$ ) do 14  $\overline{\mathcal{L}} := \overline{\mathcal{L}} \cup \{(r_i, g(r_i))\};$ 15 16 end 17 end 18 end 19 return  $\max_{r \in \mathcal{V}} \{g(r_i)\}$ ;

(日)

# Transitivity pruning

- **Observation**: do not waste time expanding nodes that (due to *transitivity*) will be explored at the next level in the tree.
- Idea: delay expansion of the "last" node/read involved in a transitivity relation.

# Strategy for selecting next sub-problem

Best First Search (BeFS): always select among the live subproblems the one with best score.

#### Depth First Search (DFS):

always select among the live subproblems the one deepest in the tree.

- <u>**Combined strategy**</u>: Use DFS as overall search strategy and BeFS when choice is to be made between nodes at the same level.
- Implementation: priority queue with precedence relation between two nodes x and y:

$$x \prec y \text{ iff } \begin{cases} depth(x) > depth(y) \\ or \\ depth(x) = depth(y) \land score(x) > score(y) \end{cases}$$

 Because BeFS is applied locally at each level the score is optimized concurrently.

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 >

# Zig-Zag function

**Problem:** given the set of overlaps O for a set of reads F, find the overlap (or set of overlaps) for a pair of reads  $(r_1, r_2)$  (if one exists).

- Naive strategy: takes time  $O(n^2)$  where n = |O|.
- **Graph approach:** takes time *O*(*I*) where *I* is the size of the longest adjacency list in the graph.
- Fast approach: hashing!

$$H(x,y) = \frac{(x+y)(x+y-1)}{2} + (1-y)$$
(1)

 $|H(x, y)| \le c$ , where *c* is function of the read size, genome structure and overlap strategy (Smith-Waterman, exact match, etc.).

# **Distributed Computing Approach**

Distribute overlapper over a cloud computing environments (e.g., Amazon Elastic Compute Cloud). SUTTA as global single process requesting the overlap information to the multiple distributed overlapper instances.

Bud Mishra (NYU)

#### Linear filter for intensities Crosstalk, fading and lagging

- Cycle:  $k \in \mathbb{N}$ :
- Input: Raw intensities:  $I_k = \begin{pmatrix} I_A^k & I_C^k & I_G^k & I_T^k \end{pmatrix}^{\top}$
- Crosstalk matrix:  $A_k \in \mathbb{R}^{4 \times 4}$
- Lagging matrix:  $\boldsymbol{\Upsilon}_k \in \mathbb{R}^{4 \times 4}$
- Output: Filtered intensities:

$$\begin{pmatrix} \mathbf{X}_{k-1} \\ \mathbf{X}_{k} \end{pmatrix} = \underbrace{\begin{pmatrix} \mathbf{A}_{k-1} & \mathbf{0} \\ \mathbf{\Upsilon}_{k} & \mathbf{A}_{k} \end{pmatrix}^{-1}}_{\mathbf{G}_{k} \in \mathbb{R}^{8 \times 8}} \cdot \begin{pmatrix} \mathbf{I}_{k-1} \\ \mathbf{I}_{k} \end{pmatrix}$$

#### Raw and Filtered Intensities Result

ъ

# **Base-by-base alignment**

Based on Burrows-Wheeler transform and Ferragina-Manzini search (like Bowtie, BWA, SOAP2, etc.). Closely related to Suffix trees:

Example: Reference T = "TACAGATTACAC\$"

# Score function

$$P_{k}(B \mid \mathbf{X}_{k}) = \frac{P_{k}(\mathbf{X}_{k} \mid B)P_{k}(B)}{P_{k}(\mathbf{X}_{k})} \quad \text{with } B \in \{A, C, G, T\}$$

$$= \frac{P_{k}(\mathbf{X}_{k} \mid B)P_{k}(B)}{P_{k}(\mathbf{X}_{k} \mid B)P_{k}(B) + P_{k}(\mathbf{X}_{k} \mid \neg B)P_{k}(\neg B)}$$

$$= \frac{1}{1 + \frac{P_{k}(\mathbf{X}_{k} \mid \neg B)P_{k}(\neg B)}{P_{k}(\mathbf{X}_{k} \mid B)P_{k}(B)}} \cdot \underbrace{\frac{P_{k}(\neg B)}{P_{k}(B)}}_{\text{Intensities}} \cdot \underbrace{\frac{P_{k}(\neg B)}{P_{k}(B)}}_{\text{Sequence alignment}}$$

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < < 回 > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >
