1 CS 202, Spring 2025
2 Handout 2 (Class 3)
3
4 The handout is meant to:
5
6 --illustrate how the shell itself uses syscalls
7
8 --communicate the power of the fork()/exec() separation
9
10 --give an example of how small, modular pieces (file descriptors,
11 pipes, fork(), exec()) can be combined to achieve complex behavior
12 far beyond what any single application designer could or would have
13 specified at design time. (We will not cover pipes in lecture today.)
14
15 1. Pseudocode for a very simple shell
16
17 while (1) {
18     write(1, "$ ", 2);
19     readcommand(command, args); // parse input
20     if ((pid ← fork()) == 0) // child?
21         execve(command, args, 0);
22     else if (pid > 0) // parent?
23         wait(0); //wait for child
24     else
25         perror("failed to fork");
26 }
27
28 2. Now add two features to this simple shell: output redirection and
29   backgrounding
30
31 By output redirection, we mean, for example:
32 $ ls > list.txt
33 By backgrounding, we mean, for example:
34 $ myprog &
35 $ 
36
37 while (1) {
38     write(1, "$ ", 2);
39     readcommand(command, args); // parse input
40     if ((pid = fork()) == 0) { // child?
41         if (output_redirected) {
42             close(1);
43             open(redirect_file, O_CREAT | O_TRUNC | O_WRONLY, 0666);
44         }
45         // when command runs, fd 1 will refer to the redirected file
46         execve(command, args, 0);
47     } else if (pid > 0) { // parent?
48         if (foreground_process) {
49             wait(0); //wait for child
50         }
51     } else {
52         perror("failed to fork");
53     }
54 }

```

*(Handwritten annotations: A large blue circle highlights the first three lines of pseudocode. A blue bracket groups the if((pid = fork()) == 0) block. Another blue bracket groups the if((pid > 0) { // parent? block. A blue arrow points from the word "foreground" in the if(foreground\_process) block to the word "foreground" in the question text above.)*

Jan 28, 25 22:56

**handout02.txt**

Page 2/4

```

56 3. Another syscall example: pipe()
57
58     The pipe() syscall is used by the shell to implement pipelines, such as
59     $ ls | sort | head -4
60     We will see this in a moment; for now, here is an example use of
61     pipes.
62
63     // C fragment with simple use of pipes
64
65     int fdarray[2];
66     char buf[512];
67     int n;
68
69     pipe(fdarray);
70     write(fdarray[1], "hello", 5);
71     n = read(fdarray[0], buf, sizeof(buf));
72     // buf[] now contains 'h', 'e', 'l', 'l', 'o'
73
74 4. File descriptors are inherited across fork
75
76     // C fragment showing how two processes can communicate over a pipe
77
78     int fdarray[2];
79     char buf[512];
80     int n, pid;
81
82     pipe(fdarray);
83     pid = fork();
84     if(pid > 0){
85         write(fdarray[1], "hello", 5);
86     } else {
87         n = read(fdarray[0], buf, sizeof(buf));
88     }
89

```

Jan 28, 25 22:56

**handout02.txt**

Page 3/4

```

90 5. Putting it all together: implementing shell pipelines using
91    fork(), exec(), and pipe().
92
93
94 // Pseudocode for a Unix shell that can run processes in the
95 // background, redirect the output of commands, and implement
96 // two element pipelines, such as "ls | sort"
97
98 void main_loop() {
99
100    while (1) {
101        write(1, "$ ", 2);
102        readcommand(command, args); // parse input
103        if ((pid = fork()) == 0) { // child?
104            if (pipeline_requested) {
105                handle_pipeline(left_command, right_command)
106            } else {
107                if (output_redirected) {
108                    close(1);
109                    open(redirect_file, O_CREAT | O_TRUNC | O_WRONLY, 0666);
110                }
111                exec(command, args, 0);
112            }
113            } else if (pid > 0) { // parent?
114                if (foreground_process) {
115                    wait(0); // wait for child
116                }
117            } else {
118                perror("failed to fork");
119            }
120        }
121
122    void handle_pipeline(left_command, right_command) {
123
124        int fdarray[2];
125
126        if (pipe(fdarray) < 0) panic ("error");
127        if ((pid = fork ()) == 0) { // child (left end of pipe)
128
129            dup2 (fdarray[1], 1); // make fd 1 the same as fdarray[1],
130            // which is the write end of the
131            // pipe. implies close (1).
132            close (fdarray[0]);
133            close (fdarray[1]);
134            parse(command1, args1, left_command);
135            exec (command1, args1, 0);
136
137        } else if (pid > 0) { // parent (right end of pipe)
138
139            dup2 (fdarray[0], 0); // make fd 0 the same as fdarray[0],
140            // which is the read end of the pipe.
141            // implies close (0).
142            close (fdarray[0]);
143            close (fdarray[1]);
144            parse(command2, args2, right_command);
145            exec (command2, args2, 0);
146
147        } else {
148            printf ("Unable to fork\n");
149        }
150    }
151
152

```

Page 4/4

```

152 6. Commentary
153
154
155 Why is this interesting? Because pipelines and output redirection
156 are accomplished by manipulating the child's environment, not by
157 asking a program author to implement a complex set of behaviors.
158 That is, the *identical code* for "ls" can result in printing to the
159 screen ("ls -l"), writing to a file ("ls -l > output.txt"), or
160 getting ls's output formatted by a sorting program ("ls -l | sort").
161
162 This concept is powerful indeed. Consider what would be needed if it
163 weren't for redirection: the author of ls would have had to
164 anticipate every possible output mode and would have had to build in
165 an interface by which the user could specify exactly how the output
166 is treated.
167
168 What makes it work is that the author of ls expressed their
169 code in terms of a file descriptor:
170     write(1, "some output", byte_count);
171 This author does not, and cannot, know what the file descriptor will
172 represent at runtime. Meanwhile, the shell has the opportunity, *in
173 between fork() and exec()*, to arrange to have that file descriptor
174 represent a pipe, a file to write to, the console, etc.

```

## handout03.txt

Page 1/4

```

1 CS 202
2 Handout 3 (Class 4)
3
4 1. Example to illustrate interleavings: say that thread tid1 executes f()
5 and thread tid2 executes g(). (Here, we are using the term "thread"
6 abstractly. This example applies to any of the approaches that fall
7 under the word "thread".)
8
9 a. [this is pseudocode]
10
11     int x;
12
13     int main(int argc, char** argv) {
14
15         tid tid1 = thread_create(f, NULL);
16         tid tid2 = thread_create(g, NULL);
17
18         thread_join(tid1);
19         thread_join(tid2);
20
21         printf("%d\n", x);
22     }
23
24     void f()
25     {
26         x = 1;
27         thread_exit();
28     }
29
30     void g()
31     {
32         x = 2;
33         thread_exit();
34     }
35
36
37 What are possible values of x after tid1 has executed f() and tid2 has
38 executed g()? In other words, what are possible outputs of the
39 program above?
40
41
42 b. Same question as above, but f() and g() are now defined as
43 follows:
44
45     int y = 12;
46
47     f() { x = y + 1; }
48     g() { y = y * 2; }
49
50     What are the possible values of x?
51
52
53
54 c. Same question as above, but f() and g() are now defined as
55 follows:
56
57     int x = 0;
58     f() { x = x + 1; }
59     g() { x = x + 2; }
60
61     What are the possible values of x?
62
63

64 2. Linked list example
65
66     struct List_elem {
67         int data;
68         struct List_elem* next;
69     };
70
71     List_elem* head = 0;
72
73     insert(int data) {
74         List_elem* l = new List_elem;
75         l->data = data;
76         l->next = head;
77         head = l;
78     }
79
80 What happens if two threads execute insert() at once and we get the
81 following interleaving?
82
83 thread 1: l->next = head
84 thread 2: l->next = head
85 thread 2: head = l;
86 thread 1: head = l;
87

```

88 3. Producer/consumer example:
89
90  /*
91   "buffer" stores BUFFER_SIZE items
92   "count" is number of used slots. a variable that lives in memory
93   "in" is next empty buffer slot to fill (if any)
94   "out" is oldest filled slot to consume (if any)
95 */
96
97  void producer (void *ignored) {
98      for (;;) {
99          /* next line produces an item and puts it in nextProduced */
100         nextProduced = means_of_production();
101         while (count == BUFFER_SIZE)
102             ; // do nothing
103         buffer [in] = nextProduced;
104         in = (in + 1) % BUFFER_SIZE;
105         count++;
106     }
107 }
108
109 void consumer (void *ignored) {
110     for (;;) {
111         while (count == 0)
112             ; // do nothing
113         nextConsumed = buffer[out];
114         out = (out + 1) % BUFFER_SIZE;
115         count--;
116         /* next line abstractly consumes the item */
117         consume_item(nextConsumed);
118     }
119 }
120
121 /*
122 what count++ probably compiles to:
123 reg1 <- count      # load
124 reg1 <- reg1 + 1    # increment register
125 count <- reg1      # store
126
127 what count-- could compile to:
128 reg2 <- count      # load
129 reg2 <- reg2 - 1    # decrement register
130 count <- reg2      # store
131 */
132
133 What happens if we get the following interleaving?
134
135     reg1 <- count
136     reg1 <- reg1 + 1
137     reg2 <- count
138     reg2 <- reg2 - 1
139     count <- reg1
140     count <- reg2
141

142
143 4. Some other examples. What is the point of these?
144
145  [From S.V. Adve and K. Gharachorloo, IEEE Computer, December 1996,
146  66-76. http://rsim.cs.uiuc.edu/~sadve/Publications/computer96.pdf]
147
148 a. Can both "critical sections" run?
149
150     int flag1 = 0, flag2 = 0;
151
152     int main () {
153         tid id = thread_create (p1, NULL);
154         p2 (); thread_join (id);
155     }
156
157     void p1 (void *ignored) {
158         flag1 = 1;
159         if (!flag2) {
160             critical_section_1 ();
161         }
162     }
163
